4.2 Light-Dependent Reactions

Photosynthesis converts light energy into chemical energy stored in glucose. The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red wavelengths.Photosynthesis converts light energy into chemical energy stored in glucose. The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red wavelengths.Photosynthesis converts light energy into chemical energy stored in glucose. The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red wavelengths.

4.2.1 The Thylakoid Membrane

Photosynthesis converts light energy into chemical energy stored in glucose. The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red wavelengths.Photosynthesis converts light energy into chemical energy stored in glucose. The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red

The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red wavelengths.Photosynthesis converts light energy into chemical energy stored in glucose. The process takes place in the chloroplasts, where chlorophyll absorbs light most efficiently in the blue and red wavelengths.

- Light is absorbed by Photosystem II.
- Electrons move along the chain.
- ATP synthase produces ATP.
